

## Bhargav Kacharla

kacharlabhargav21@gmail.com • +91 9146703115 • [LinkedIn](#) • [GitHub](#) • [Website](#)

Senior Backend Engineer with 10 years of experience building distributed systems, including 6 years building production DeFi and Web3 systems across EVM and Solana. I've shipped smart contracts spanning perpetuals, options, staking, prediction markets, and tokenized vaults, along with distributed backend systems: real-time indexers, event-driven pipelines, and low-latency services

### EXPERIENCE

---

#### Nunchi.trade

Remote, India

Senior Engineer(Blockchain and Agents)

July '25 - May '26

- Built core protocol components for an on-chain perpetuals platform, including on-chain CLOB, Clearing House settlement, risk engine, liquidation flows, and oracle integrations(Pyth, Stork).
- Designed a real-time indexer sustaining **1000 events/min**, streaming contract events through Kafka into low-latency position, order, funding/risk, and liquidation state, with Redis serving hot-path reads
- Worked with Quantstamp and Zelic on external audits, owned the full audit lifecycle: triaged findings, applied fixes, and coordinated re-review.
- Conducted protocol security reviews and adversarial analysis around liquidations, oracle manipulation, settlement correctness, and incentive flows; secured contracts with Slither and Trail of Bits tooling.
- Developed an on-chain agent marketplace (ERC-8004 / ERC-8183) where agents register for protocol jobs, complete them, and submit proof-of-completion to claim incentives.

#### Novastro

Remote, India

Blockchain and Backend Engineer

Apr '24 - Jun '25

- Implemented account abstraction using ERC-4337, including smart accounts, paymasters, bundler integrations, and wallet-to-contract execution flows for an asset tokenization platform for financial institutions.
- Developed ERC-3643 RWA tokenization flows with on-chain compliance, identity registry integration, and token issuance.
- Designed and maintained upgradeable Solidity contracts for a prediction market protocol with attention to proxy patterns, storage layout, initializer safety, access control, and deployed the contracts on polygon mainnet.
- Built ERC-4626 tokenized vault where users deposit collateral, mint share tokens, and earn cross-protocol yield routed through Aave and Stader, with correct share/asset conversion, deposit and withdrawal flows, and yield accrual handled on-chain.
- Developed and maintained smart contract tests for tokenized vaults, prediction markets and automated yield accrual across multiple protocols.
- Developed subgraphs for contracts deployed in various chains using graph protocol.

#### Oddz

Bangalore, India

Blockchain Engineer

Jan '21 - Dec '23

- Led smart contract development for Oddz protocol (oddz.fi), an options trading platform with concentrated liquidity (Uniswap V3-style) for capital-efficient risk management, staking, and liquidity provisioning. Contracts deployed in Avalanche and BNB chain mainnets.
- Pioneered research on derivative trading in the crypto ecosystem, building a protocol with yield generation mechanisms and enhanced trading capabilities
- Built a staking vault for liquidity providers and ODDZ holders, with reward accrual and distribution, and fee discount tiers, using an accumulator based reward model to keep user payouts correct and gas-efficient at scale
- Built automation systems for options protocol workflows, including expiry handling, staking reward distribution, and dynamic risk adjustments using Chainlink Keepers and Gelato for on-chain execution.

#### Rakuten

Bangalore, India

Senior Software Engineer

Oct '20 - Jan '21

- Architected Datalake for Rakuten telecom department for data scientists to develop intelligent models.
- Research big data technologies for building Datalake to handle petabytes of data using MinIO and YugaByte.

#### OpenText

Bangalore, India

Senior Software Engineer

Jul '18 - Sept '20

- Developed REST services and enterprise web applications using .NET MVC, TypeScript, and Angular integrating content management systems with third-party APIs.

#### Tata Consultancy Services

Bangalore, India

Software Engineer

May '15 - Jun '18

- Developed enterprise web applications for banking and telecom clients using C# .NET, JavaScript, and SQL Server. Optimized SQL Server stored procedures, reducing report generation time by 40%

### AGENTS

---

OrgGPT - <https://orggpt.app/>

- Built OrgGPT, a multi-tenant context-graph SaaS that unifies a company's GitHub, Notion, Slack, and docs into one always-fresh knowledge graph and serves grounded, cited answers to AI coding agents.
- Developed the full RAG pipeline durable ingestion, heading- and code-aware chunking, OpenAI embeddings over a Qdrant vector store, and an agentic retrieve-then-answer loop with enforced citations.

### SKILLS

---

**Blockchain** Solidity, Rust (Anchor), Account abstraction(4337), Tokenized vault(4626), Agent Commerce(8004/8183), Foundry, hardhat, upgradeable contracts, Chainlink, Pyth, Gelato, Slither, Trail of Bits tooling, Smart contract security.

**Backend** TypeScript, Node.js, AWS, GCP, Distributed systems, event driven architectures, Kafka, Redis, Postgres, MongoDB  
**AI / LLM** Anthropic SDK, OpenAI SDK, RAG pipelines, multi-agent orchestration, context engineering, eval frameworks.

### EDUCATION

---

Bachelor of Technology in **Computer Science and Engineering** SASTRA University, Thanjavur, India
